The Quiet Soundproofing System, from PABCO® Gypsum, is engineered to maximize superior soundproofing performance creating quiet and comfort in buildings. All system components, including QuietRock, QuietSeal Pro, and QuietPutty, are designed to prevent sound transmission and maintain high acoustic performance through walls, floors, and ceilings. QuietRock sound-reducing drywall offers outstanding acoustic performance without sacrificing valuable floor space. QuietRock products are developed with patented "thin wall technologies" to improve Sound Transmission Class (STC) performance using less material and time needed to install. Often, QuietRock outperforms multiple layers of gypsum drywall and can exceed STC requirements for most wall applications, and is more reliable than the resilient channel. QuietRock products range from 1/2", 5/8", and 1-3/8" thicknesses, providing options for specific design and soundproofing goals. PABCO® Gypsum sells its QuietRock® panel products exclusively through authorized distributors throughout the US and Canada.
