Fundermax is a manufacturer of high-pressure laminate (HPL) panels known for their extreme durability and customizability in current architectural projects. Also known as phenolic panels, these panels provide creative and technical components that offer a positive change in the way exterior and interior structures are designed and built. The manufacturing process begins with natural, cellulose fiber panels consisting mainly of wood that has been processed into "kraft papers." Fundermax sources these raw materials from vendors certified according to Forestry Stewardship Council standards (FSC) or PEFC. A synthetic polymer (phenolic resin) and a decorative layer are added to the layers of kraft paper and then cured under high heat and pressure. This results in Fundermax panels being: Easy to install, Scratch and graffiti resistant, Non-porous and moisture resistant, Anti-bacterial, UV and weather-resistant, Easy to clean, Chemical resistant. Fundermax North America Inc. is a subsidiary of Fundermax headquartered in Australia, dedicated to providing the best service and support in the industry.
